

Antibiotic Stewardship

It's everyone's business

Ali Harmouche
Consultant Physician
Acute Medicine
SJH Livingston

Our mission

- Reduce unnecessary/inappropriate antibiotic use/ prevent harm
- Supporting doctors by promoting good practice
- Regular Audit and feedback

Our AMT (virtual)

- No dedicated pharmacist
- Advice available from microbiologist, ID.
- Regular review by microbiologist/ID of patients with proven bacteraemia/complicated cases/ITU/plastics
- Ward pharmacists will assist with IV antibiotic management (mainly vancomycin and gentamicin)
- Junior doctors and antimicrobial nurse help collecting data/identifying areas of improvement and re-audit

What influences doctors decision making when it come to antibiotic prescribing?

- Availability and ease of access to local protocol/guidance
- How important factor is CDI/AMR
- Prescribing etiquette/ local culture

Availability and ease of access to local protocol/advice

Short survey of 20 trainees

- Everyone knew the different forms (Poster, portal guide and App as well as micro consultant telephone advice) available and how to access them

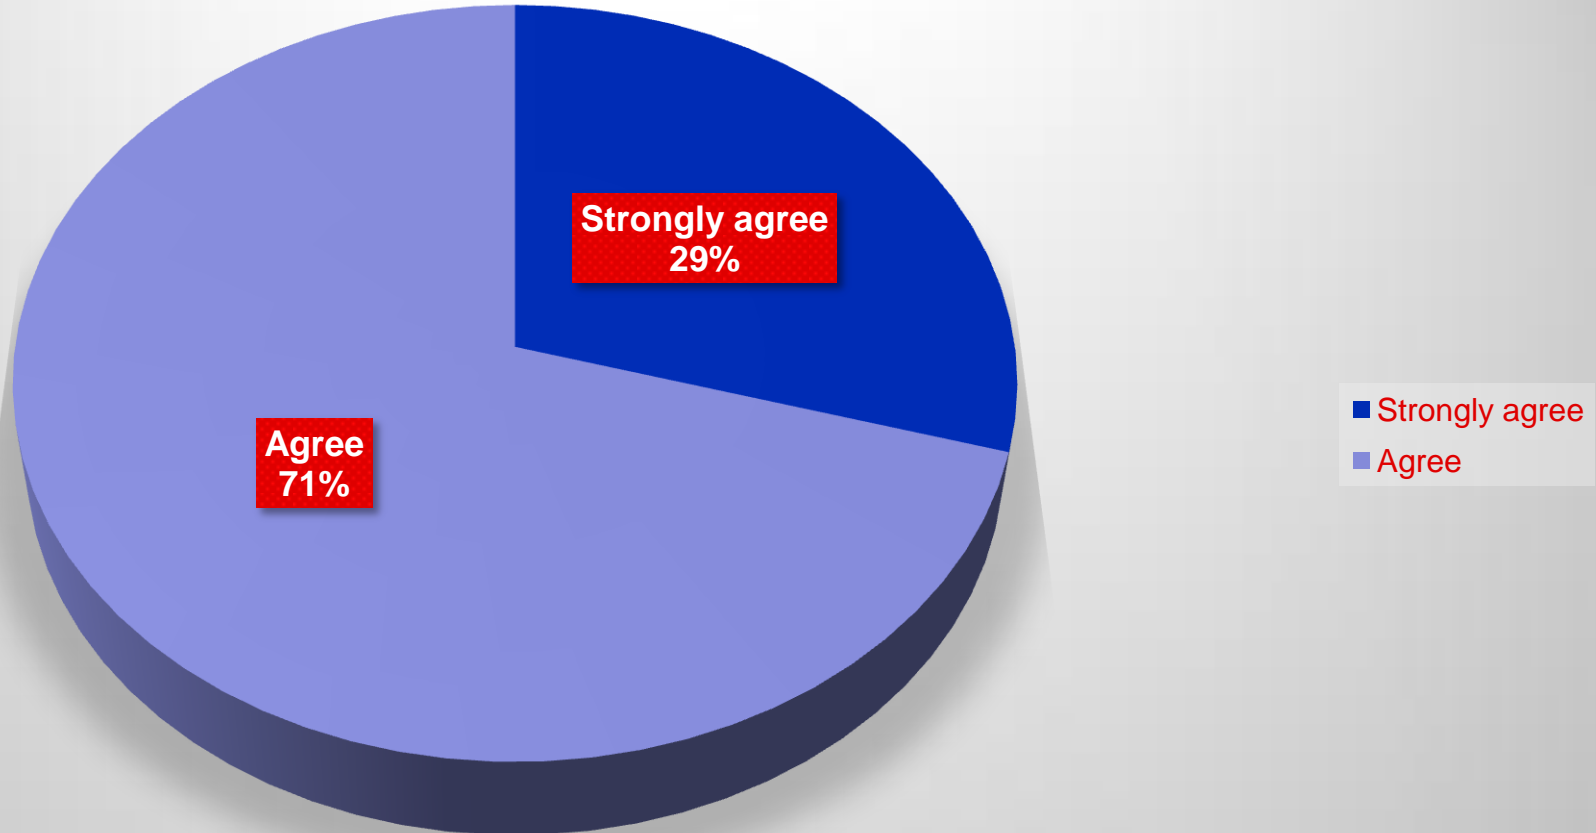

What is your most preferred tool?

The winner is...

NHS Lothian		UHD Adult Antimicrobial Guidelines (2015/16)		NHS Lothian	
http://intranet.lothian.scot.nhs.uk/NHSLothian/Healthcare/A-Z/amt or search on 'antimicrobial guidelines' from intranet homepage		Prepared by Lothian Antimicrobial Management Team Release version 6.0 Feb 2015 Not valid after 31st July 2016			
All antibiotic doses should be reviewed in patients with a creatinine clearance of 10mls/min or less					
		Indication	First Line	Alternative/2nd Line	Typical Duration
Prudent Antimicrobial Practice					
Before you prescribe antimicrobials:					
<ul style="list-style-type: none"> Review all antimicrobials regularly; always record the indication and intended duration in case notes and drug chart Send appropriate specimens before you start antimicrobials (blood, CSF, urine, sputum, wound swab) Follow UHD Antimicrobial Guidelines Write a review or stop date on the drug chart. Use antimicrobial with narrowest spectrum for the shortest possible duration. Check for allergies & document on drug chart. 					
Additional good practice points:					
<ul style="list-style-type: none"> Review all antimicrobials regularly; de-escalate and narrow therapy as soon as sensitivity results are available Consult microbiology or ID physician if the patient does not respond within 48-72 hrs Avoid unnecessary intravenous use, use oral route if no reason for IV. 					
Indications for IV Delivery					
<ol style="list-style-type: none"> Serious sepsis Febrile neutropenia or immunosuppression[‡] Specific infections <ul style="list-style-type: none"> severe pneumonia, endocarditis encephalitis, brain abscess, meningitis septic arthritis, osteomyelitis severe soft tissue infection Oral route compromised <ul style="list-style-type: none"> nil by mouth reduced absorption swallowing problem coma no oral formulation 					
Review need for IV route 48hrs after initiation and at least every 24hrs thereafter.					
[‡] seek specialist advice					
Switch from IV to oral when:					
<ul style="list-style-type: none"> temperature <38°C for 48hrs patient clinically improved and CRP, WBC improving oral fluids/foods tolerated and poor oral absorption of antibiotics unlikely suitable oral alternative. 					
See full guidelines for oral step down options.					
Pneumonia severity assessment (CURB65)					
Confusion (new or AMT score ≤8)					
Urea ≥7mmol/l					
Respiratory rate ≥ 30/min					
BP DBP ≤60mmHg Or SBP <90mmHg					
Aged ≥65 years					
Plus evidence of consolidation on CXR					
Gentamicin and Vancomycin					
For gentamicin and vancomycin dosing and monitoring guides, see separate guidelines on AMT intranet site.					
Gentamicin requires daily monitoring of levels and must not be continued for more than 3 days without discussion with Microbiology or Infectious Diseases.					
Notes:					
<ul style="list-style-type: none"> Seek urgent advice from Microbiology, ID or relevant specialists (eg surgery, haematology, oncology) * Modify dose in renal impairment S significant drug interactions 					
		All antibiotic doses should be reviewed in patients with a creatinine clearance of 10mls/min or less			
		Indication	First Line	Alternative/2nd Line	Typical Duration
Skin & Soft Tissue	Cellulitis Mild	flucloxacillin 500mg qds orally		clarithromycin* ^S 500mg bd orally	5-10 days
	Cellulitis Severe	flucloxacillin 2g qds IV		vancomycin*  	
	Bites				
Symptomatic Catheter UTI	See full guidelines (Appendix 2) for decision aid. Systemic symptoms: a single dose of gentamicin* with catheter change (see full guideline) may be sufficient; otherwise treat according to diagnosis (cystitis/pyelonephritis). N.B. gentamicin not normally needed with routine catheter change			1 dose	
Lower UTI (cystitis)	trimethoprim* ^S 200mg bd orally (3 days female; 7 days male)		nitrofurantoin 50mg qds orally (3 days female; 7 days male); (do not use if eGFR<45 ml/min/1.73m ²)		
Upper UTI (pyelonephritis)	If prostatitis suspected: 		amoxicillin 500mg tds orally (or 1g tds IV) plus daily gentamicin* max. 3 days then stop or discuss 	ciprofloxacin* ^S 500mg bd orally (7 days)	14 days
MRSA	Non-severe	doxycycline ^S 100mg every 12 hours orally			
	Severe	vancomycin* 			
Sepsis	Neutropenic	piperacillin/tazobactam* 4.5g qds IV plus gentamicin*  add clarithromycin* ^S 500mg bd IV if chest infection add metronidazole ^S 500mg tds IV if lower GI symptoms Penicillin allergy: 			
	Intraabdominal (community acquired e.g. peritonitis, diverticulitis)	amoxicillin 1g tds IV plus daily gentamicin*  (max. 3 days then stop/discuss) plus metronidazole ^S 400mg tds orally (or 500mg tds IV)		Penicillin allergy: vancomycin* 	
	Unknown site MILD	amoxicillin 500mg tds orally plus trimethoprim* ^S 200mg bd orally		Penicillin allergy: doxycycline ^S 200mg od orally instead of amoxicillin	
Sepsis	Unknown site SEVERE	amoxicillin 1g tds IV plus daily gentamicin*  (max. 3 days then stop/discuss) plus metronidazole ^S 400mg tds orally (or 500mg tds IV)		Penicillin allergy: vancomycin* 	
		Consider adding flucloxacillin or vancomycin* if particular concern re staphylococcal infection			
Meningitis	ceftriaxone ^S 2g bd IV If >50years, pregnant, immunocompromised or on steroids add amoxicillin 2g every 6 hours IV. If pneumococcal meningitis likely give dexamethasone 10mg qds IV before, with or within 4 hours of first antibiotic dose 				
COPD (inf. exac.) or LRTI (no CXR changes)	doxycycline ^S 200mg day 1 then 100mg daily orally (4 days)		amoxicillin 500mg tds orally	5 days	
Hospital Acquired Pneumonia (HAP)	Early (hospital stay <5 days)	Assess and treat as CAP (see below)		5-7 days 	
	Late (hospital stay ≥ 5 days) AND mild	doxycycline ^S 200mg daily orally		5-7 days 	
	Late (hospital stay ≥ 5 days) AND moderate or severe	piperacillin/tazobactam* 4.5g tds IV Previous MRSA respiratory colonisation: add vancomycin* 		Penicillin allergy: vancomycin*  plus ciprofloxacin* ^S 500mg bd orally 	
Community Acquired Pneumonia (CAP)	CURB65 0-1	amoxicillin 500mg tds orally		doxycycline ^S 200mg day 1 then 100mg daily orally (6 days)	7 days
	CURB65 2	amoxicillin 500mg tds orally or IV plus clarithromycin* ^S 500mg bd orally or IV			
	CURB65 3-5	co-amoxiclav* 1.2g tds IV plus clarithromycin* ^S 500mg bd IV		ceftriaxone ^S 2g daily IV plus clarithromycin* ^S 500mg bd IV	7-10 days

Does AMR influence your prescribing

Does the risk CDI influence you prescribing

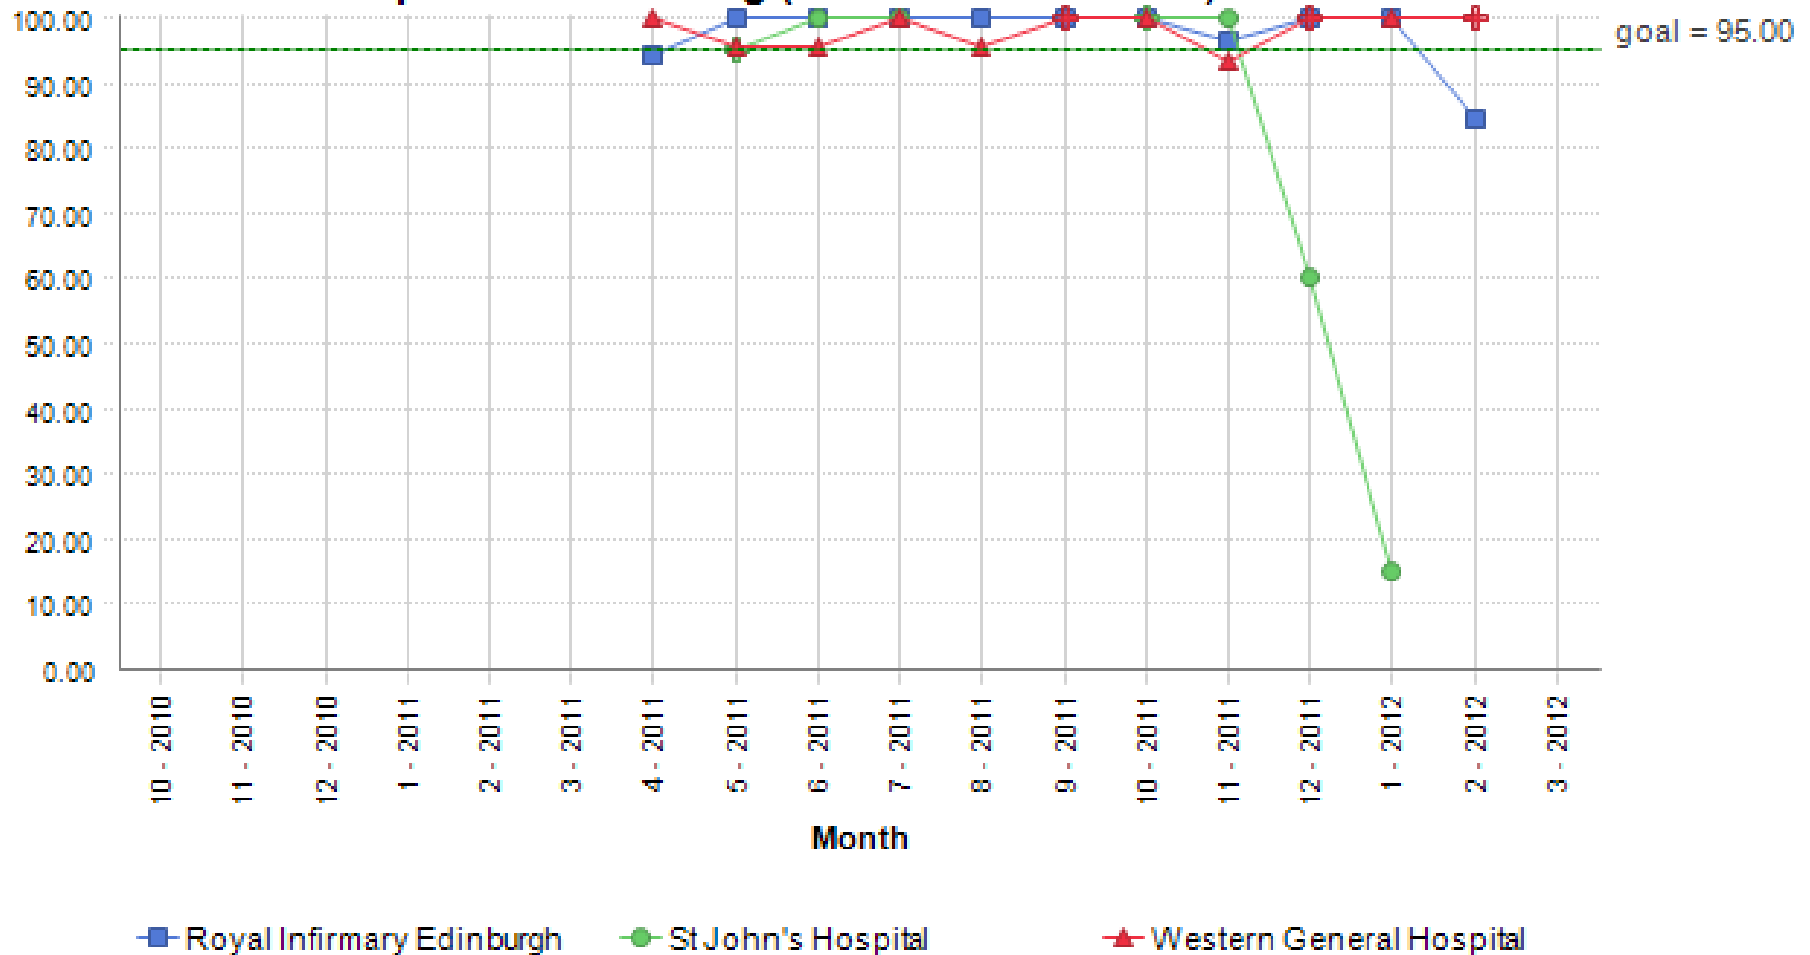

What this short survey tell us

- The best and easier to access is the poster "the most useful poster the NHS ever produced"
- AMR is seen as important, but "this is what might happen in the future"
- CDI is more of an acute problem and therefore seen as more relevant

Where did we started from

Empirical Prescribing (Medical Admissions):NHS Lothian
Empirical Prescribing (Medical Admissions): Indication documented -
Empirical Prescribing (Medical Admissions):NHS Lothian

Antibiotic choice compliant

Empirical Prescribing (Medical Admissions):NHS Lothian
Empirical Prescribing (Medical Admissions): Policy compliant - Empirical
Prescribing (Medical Admissions):NHS Lothian

Duration/review/stop date

Empirical Prescribing (Medical Admissions):NHS Lothian
Empirical Prescribing (Medical Admissions): Duration or Review Documented -
Empirical Prescribing (Medical Admissions):NHS Lothian

Empirical Prescribing indicators - Element Compliance SJH MAU

- Indication documented
- Compliant with guidelines
- Duration documented
- SAPG 95% target

MAU data

Empirical Prescribing Indicators - Element Compliance SJH - MAU

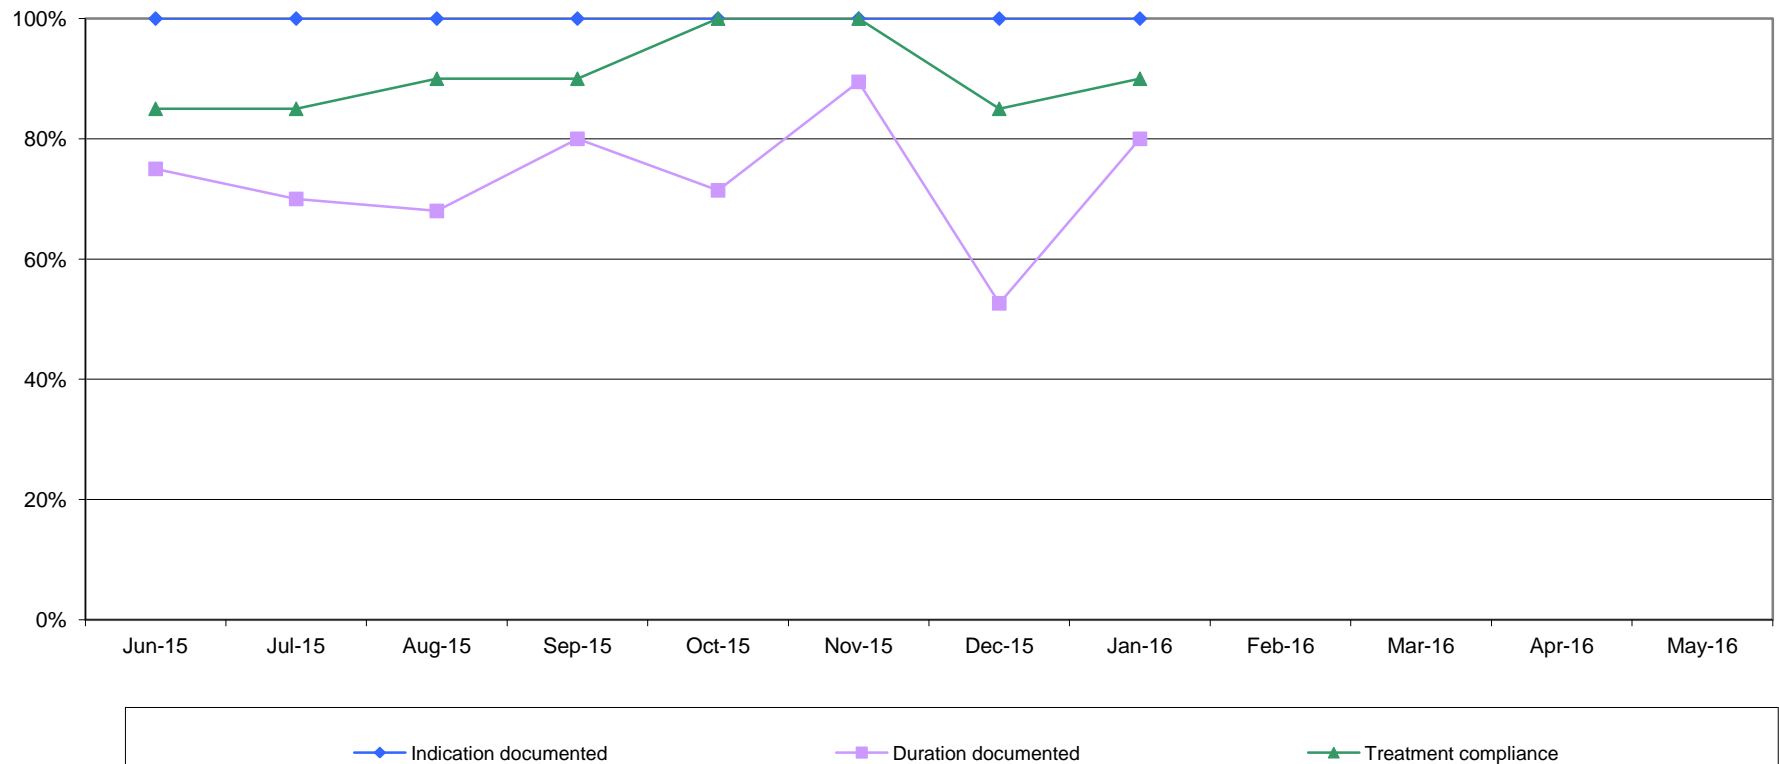

—◆— Indication documented

—■— Duration documented

—▲— Treatment compliance

Downstream wards data

Empirical Prescribing Indicators - Element Compliance SJH - Wards 21 & 25

Trends

- Diagnosis is reliably hitting target
- Antibiotic compliant with guidance: not far behind, but not there yet
- Duration/review/stop date is the weakest measure

Difficulties

- Pneumonia often documented as CAP/LRTI with no severity scoring
- Exacerbation of COPD often documented as CAP/LRTI
- Just in case prescribing
- Often diagnosis documented - Confusion? Infection (?RTI/UTI)
- Staff turnover/ Senior doctors attitudes/Nursing staff lack empowerment
- Cleaning the stairs starts from the top/making data count

Co-amoxiclav use by board (acute teaching hospitals only) - DDDs per 1,000 OBDs

NHS Grampian NHS GG&C

NHS Lothian NHS Tayside

DDD's per 1,000 obd

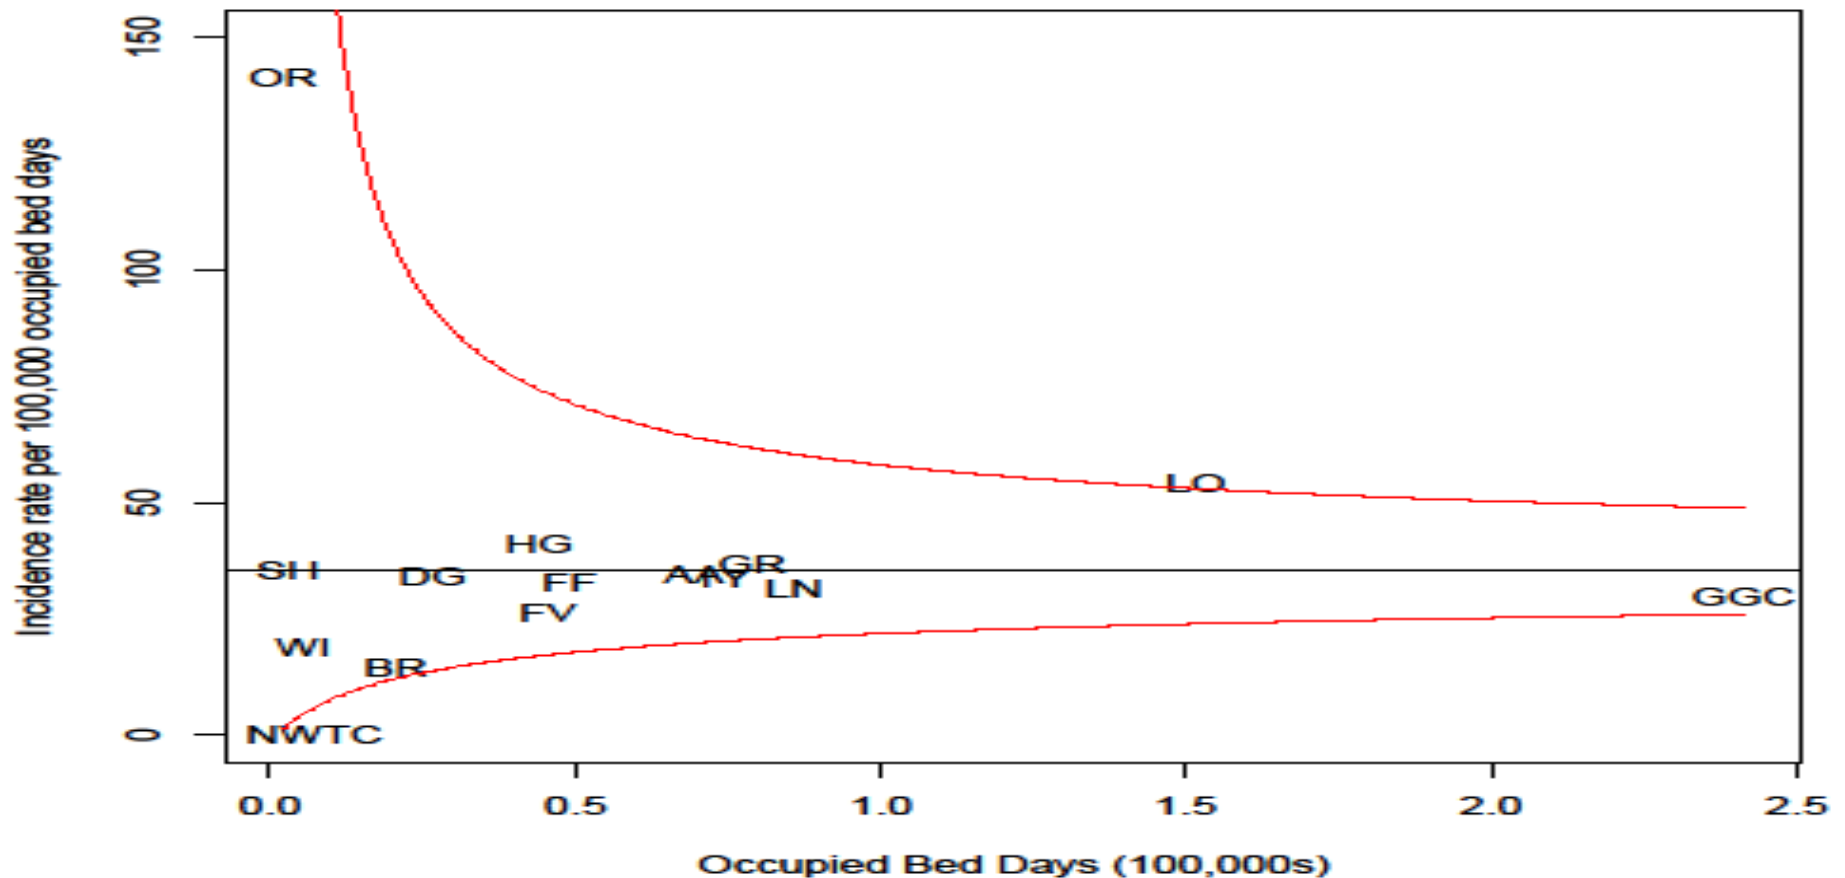

Financial year/quarter

CDI cases per occupied bed stays (15+) in Health Boards across NHS Scotland

NHS Board	Year ending December 2014	NHS Board target (due for delivery 2014/15)
NHS Ayrshire & Arran	0.37	0.32

CDI infection at SJH

Clostridium difficile Infection for NHS Lothian

This Chart shows the total number of *Clostridium difficile* Infection (CDI) Episodes for the Location specified above. This data is derived from the NHS Lothian Laboratory Computer System and is based on the Location submitting specimens for analysis.

The number of infections per month are plotted together with the average for the data period this chart reflects. In addition the Warning Line (WL) and Uper Control Line (UCL) are shown. These are used to help identify when a Location may have an increase

Comments

Progress against HEAT Target to March 2016

3 of 26 Progress against HEAT Target | Updated March 2016

	CDI Summary		SAB Summary	
	<i>n</i>	HEAT	<i>n</i>	HEAT
HEAT Target Allowance	262	0.32	184	0.24
NHS Lothian	304	0.40	218	0.29
Royal Infirmary of Edinburgh	76	0.26	100	0.34
Western General Hospital	89	0.40	72	0.32
St Johns Hospital	37	0.31	27	0.23
Liberton Hospital	4	0.09	5	0.11
Royal Hospital for Sick Children	3	0.11	10	0.36

This report card shows the progress against HEAT Target for NHS Lothian and main acute hospital sites from April 2015 to January 2016
 NHS Lothian progress is calculated using the national Bed Day Data published by Health Protection Scotland
 Hospital Site progress is calculated using local bed day data

Thank you
